

Lecture 12 - Taylor-Wiles primes, III

$$S = (\bar{\rho}, S, N, \mathcal{O}, \{D_v\}_{v \in S}), \quad T \subseteq S, \quad p > 2$$

$$\bar{\rho}: G_{F,S} \rightarrow GL_2(\mathbb{F})$$

is s.t.

- $\bar{\rho}|_{G_{F(\mu_p)}}$ is abs. irr.
- signals of all $\bar{\rho}(G)$ are distinct / \mathbb{F} (conjugacy iff nsc)

Recall $\Gamma = \bar{\rho}(G_{F(\mu_p)})$ is enormous (\Leftrightarrow adequate) if

E1. Γ has no quotient of order p

$$E2. \quad H^0(\Gamma, \text{ad}^0) = H^1(\Gamma, \text{ad}^0) = 0$$

E3. For any simple $\mathbb{F}[\Gamma]$ -submod W of ad^0 ,
 $\exists \gamma \in \Gamma$ s.t. $W^\gamma \neq 0$ and γ has distinct signals.

Prop S as above and $\Gamma = \bar{\rho}(G_{F(\mu_p)})$ is enormous.

Let $g = h_{S \setminus T}^{\pm}(\text{ad}^0 \bar{\rho}(1))$. Then for any $N \geq 1$,
 we can find a set of Taylor-Wiles primes \mathcal{Q}_N of
 level N s.t. $q_v \equiv 1 \pmod{p^N}$ for all $v \in \mathcal{Q}_N$ s.t.

$$1. \quad |\mathcal{Q}_N| = g.$$

$$2. \quad H_{S \setminus \mathcal{Q}_N, T}^1(\text{ad}^0 \bar{\rho}(1)) = 0.$$

Proof: Fix $N \geq 1$. Assuming we have TW primes

$$\mathcal{Q}' = \{v_1, \dots, v_{j-1}\} \text{ of level } N \text{ with } 1 \leq j \leq g \text{ and}$$

$$h_{S \setminus \mathcal{Q}', T}^{\pm}(\text{ad}^0 \bar{\rho}(1)) = g - (j-1)$$

we show how to find a TW prime v_j of (s, r) N sub

$$h_{\mathcal{S} \perp}^{\perp} \mathcal{S}_{\mathcal{Q}' \cup \{v_j\}, T}^{\perp} (\text{cd}^{\circ} \bar{\rho}(1)) = q^{-j}$$

Fix $0 \neq [\mathcal{X}] \in H_{\mathcal{S} \perp, T}^1(\text{cd}^{\circ} \bar{\rho}(1))$ with \mathcal{X} a cocycle

rep the cohen class $[\mathcal{X}]$. It suffices to show \exists only many TW primes $v \in S$ of F sub

(a) $q_v \equiv 1 \pmod{\rho^N}$

(b) $\bar{\rho}(\text{Frob}_v)$ has distinct signals

(c) $H^1(F_v/F_v, \text{cd}^{\circ} \bar{\rho}(1)) \xrightarrow{\sim} H^1(F_v^w/F_v, \text{cd}^{\circ} \bar{\rho}(1))$

If v satisfies (a) and (b), then

$$H^1(F_v^w/F_v, \text{cd}^{\circ} \bar{\rho}(1)) \cong \text{cd}^{\circ} \bar{\rho} / (\text{Frob}_v - 1) \text{cd}^{\circ} \bar{\rho}$$

$$[\varphi] \mapsto \varphi(\text{Frob}_v)$$

and RHS is 1-dim under (b), so we can replace (c) with

(c') $\mathcal{X}(v) \notin (\text{Frob}_v - 1) \text{cd}^{\circ} \bar{\rho}$

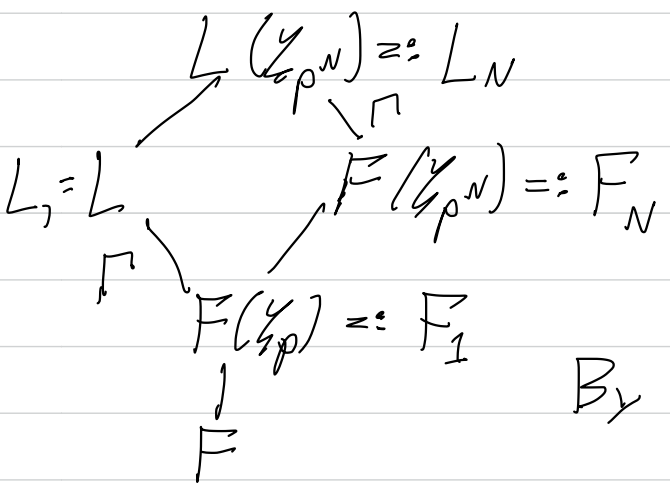

By Chebotarev, it suffices to show $\exists \sigma \in G_{F, S}$ s.t.

(a) $\sigma \in G_{F(\zeta_{p^N})}$

(b) $\bar{\rho}(\sigma)$ has distinct signals

(c) $\mathcal{X}(\sigma) \notin (\sigma - 1) \text{cd}^{\circ} \bar{\rho}$.

Let $L/F(\zeta_p)$ be the ext ant ant by $\bar{\rho}|_{G_{F(\zeta_p)}}$

Notes by E1 of exercises
 $\Rightarrow L_N \cap F_N = F_1$

Claim: $H^1(L_N/F, \text{ad}^{\circ}_{\bar{\rho}}(\mathbb{1})) = 0$

By inflation-restriction, we have

$$\begin{aligned}
 0 &\Rightarrow H^1(F_N/F, \underbrace{(\text{ad}^{\circ}_{\bar{\rho}}(\mathbb{1}))}^{\text{Gal}(L_N/F_N)}) \rightarrow H^1(L_N/F, \text{ad}^{\circ}_{\bar{\rho}}(\mathbb{1})) \\
 &\quad \cdot H^0(\Gamma, \text{ad}^{\circ}_{\bar{\rho}}) \rightarrow H^1(L_N/F_N, \text{ad}^{\circ}_{\bar{\rho}}(\mathbb{1})) \\
 &\quad \downarrow \quad \quad \quad \parallel \\
 &\quad \circ \text{ by E2} \quad \quad H^1(\Gamma, \text{ad}^{\circ}_{\bar{\rho}}) \\
 &\quad \quad \quad \parallel \\
 &\quad \quad \quad \circ \text{ by E2.}
 \end{aligned}$$

The claim follows.

So by inf-res,

$H^1(F_3/F, \text{ad}^{\circ}_{\bar{\rho}}(\mathbb{1})) \rightarrow H^1(F_3/L_N, \text{ad}^{\circ}_{\bar{\rho}}(\mathbb{1}))^{\text{Gal}(L_N/F)}$
 is injective. In part,

$$\begin{aligned}
 0 \neq \text{res}([\mathbb{1}]) &\in H^1(F_3/L_N, \text{ad}^{\circ}_{\bar{\rho}}(\mathbb{1}))^{\text{Gal}(L_N/F)} \\
 &\subseteq \text{Hom}_{\Gamma}(\text{Gal}(F_3/L_N), \text{ad}^{\circ}_{\bar{\rho}})
 \end{aligned}$$

Let W be a nonzero mod subspace of the \mathbb{F} -span of $\mathbb{1}(\text{Gal}(F_3/L_N)) \subseteq \text{ad}^{\circ}_{\bar{\rho}}$.

By E3, we can find $\sigma_0 \in \text{Gal}(L_N/F_N)$ s.t.

$W^{\sigma_0} \neq 0$ and $\bar{\rho}(W^{\sigma_0})$ has distinct eigenvals.

So if $\mathcal{L}(\sigma_0) \notin (\sigma_0 - 1) \text{ad}^0 \bar{\rho}$, w.s. take $\sigma = \sigma_0$ and are done.

Now assume $\mathcal{L}(\sigma_0) \in (\sigma_0 - 1) \text{ad}^0 \bar{\rho}$.

Conj it's nec, w.s. can assume that

$$\bar{\rho}(\sigma_0) = \begin{pmatrix} \alpha & 0 \\ 0 & \beta \end{pmatrix} \quad \alpha \neq \beta.$$

So $(\sigma_0 - 1) \text{ad}^0 \bar{\rho} = \{ \begin{pmatrix} 0 & * \\ * & 0 \end{pmatrix} \}$, which has no nonzero $\bar{\rho}(\sigma_0)$ -invariant vectors.

$$\Rightarrow W \notin (\sigma_0 - 1) \text{ad}^0 \bar{\rho}$$

$$\Rightarrow \mathcal{L}(\text{Gal}(\mathbb{F}_3/LW)) \notin (\sigma_0 - 1) \text{ad}^0 \bar{\rho}$$

$$\Rightarrow \exists \gamma \in \text{Gal}(\mathbb{F}_3/LW) \text{ s.t. } \mathcal{L}(\gamma) \notin (\sigma_0 - 1) \text{ad}^0 \bar{\rho}.$$

Take $\sigma = \gamma \sigma_0$. Then

$$\sigma \in G_{\mathbb{F}_N} \text{ and } \bar{\rho}(\sigma) = \bar{\rho}(\sigma_0)$$

and

$$\mathcal{L}(\sigma) = \mathcal{L}(\gamma \sigma_0) = \gamma \mathcal{L}(\sigma_0) + \mathcal{L}(\gamma)$$

$$= \underbrace{\mathcal{L}(\sigma_0)}_{\in (\sigma_0 - 1) \text{ad}^0 \bar{\rho}} + \underbrace{\mathcal{L}(\gamma)}_{\notin (\sigma_0 - 1) \text{ad}^0 \bar{\rho}}$$

$$\in (\sigma_0 - 1) \text{ad}^0 \bar{\rho} \quad \notin (\sigma_0 - 1) \text{ad}^0 \bar{\rho}$$

$$\Rightarrow \mathcal{L}(\sigma) \notin (\sigma_0 - 1) \text{ad}^0 \bar{\rho} = (\sigma - 1) \text{ad}^0 \bar{\rho}.$$

This concludes the proof. \square

If we further assume that D_v for $v \in S$ are nice, i.e. as Cases 1 and 2 from last time, we get

Cor $\exists q \geq 0$ s.t. $\forall N \geq 1$, there is a set \mathcal{Q}_N of $7N$ primes of level N and a surjection

$$R_S^{\Gamma\text{-loc}}[X_1, \dots, X_q] \twoheadrightarrow R_S^{\mathcal{Q}_N}$$

where

(a) Case 1 ($T = \emptyset, R_S^{T-loc} = \mathcal{O}$), $g = q$

(b) Case 2 ($T \geq \{v\}$, e.g. $T = S$)
 $\dim R_S^{T-loc} + g = q + 4|T|.$

A Taylor-Wiles datum $(Q, \{\alpha_v\}_{v \in Q})$ is a set Q of TW primes and a choice α_v of eigenvalue of $\bar{\rho}(Frob_v)$ for each $v \in Q$.

We saw prev that if

$$\rho^{unv} : G_{F,S} \rightarrow GL_2(R_{S_Q})$$

is the unramified type S_Q -det, then for any $v \in Q$,

$$\rho^{unv}|_{G_{F_v}} \cong \chi_{v,1} \oplus \chi_{v,2}$$

with $\chi_{v,i} \circ \text{Art}_{F_v} : \mathcal{O}_{F_v}^\times \rightarrow R^\times$ factors through $\Delta_v := \max \rho$ -power and quotient S_Q of $(\mathcal{O}_{F_v}/\mathfrak{m}_v)^\times$

Choice of eigenval α_v of $\bar{\rho}(Frob_v)$ determines an ordering of $\chi_{v,1}, \chi_{v,2}$ by $\chi_{v,1}(Frob_v) = \alpha_v$.

Thus a TW datum

$\Rightarrow \mathcal{O}$ -alg map $\mathcal{O}[\Delta_Q] \rightarrow R_{S_Q}$ by $\mathcal{O} \in \Delta_v \mapsto \chi_{v,1}(\mathcal{O})$
 and the surj $R_{S_Q} \twoheadrightarrow R_S$

has kernel $\alpha_Q = \text{aug ideal of } \mathcal{O}[\Delta_Q], \Delta_Q = \prod_{v \in Q} \Delta_v$

Then we have, letting $q = |Q|$, $Q = \{v_1, \dots, v_q\}$

Case 1

$$\mathcal{A}_{\mathcal{A}} = (y_1, \dots, y_q) \subset \mathcal{O}[\mathbb{Z}_p^q] \cong \mathcal{O}[y_1, \dots, y_q] =: S_{\mathcal{A}}$$

$= \text{aug ideal}$

$$\begin{array}{c} \mathcal{O}[\mathbb{Z}_p^q] \\ \downarrow \\ \mathcal{O}[\Delta_Q] \end{array}$$

$1 \mapsto y_i$
 \downarrow
gen of Δ_Q

$$\mathcal{O}[x_1, \dots, x_q] \rightarrow R_{S_Q}$$

st. $R_{S_Q} / \mathcal{A}_{\mathcal{A}} \cong R_S$

And if Q is as in the Cor from today, then $q = q$.

Case 2 Fix iso $R_{S_Q}^T \cong R_{S_Q}[\mathbb{Z}_1, \dots, \mathbb{Z}_{4|T|-1}] \cong R_{S_Q}^T \hat{\otimes} T$

$$T := \mathcal{O}[\mathbb{Z}_1, \dots, \mathbb{Z}_{4|T|-1}]$$

$$\mathcal{A}_{\mathcal{A}} = (y_1, \dots, y_q) \subset T[\mathbb{Z}_p^q] \cong T[y_1, \dots, y_q] = \mathcal{O}[\mathbb{Z}_1, \dots, \mathbb{Z}_{4|T|-1}, y_1, \dots, y_q]$$

$$\begin{array}{c} T[\mathbb{Z}_p^q] \\ \downarrow \\ T[\Delta_Q] \end{array}$$

st. $R_{S_Q}^T / \mathcal{A}_{\mathcal{A}} \cong R_S^T$

and if Q is as in the Cor, then

$$\dim R_S^{T-\text{loc}}[x_1, \dots, x_q] = \dim S_{\mathcal{A}}$$
